Prime Care Medical Office Assistant: App Walkthrough Script

Physician & Clinic EHR Platform | Full Tab-by-Tab Live Screen Recording Guide

Presenter & Lead Architect: Suganthan Subramanian | Faculty of Engineering, University of Ottawa
Platform: Prime Care Medical Office Assistant (Hackers-Healers-1) | Target Time: ~4:30 min

Platform Architecture: Prime Care is a full-stack Electronic Health Record (EHR) and AI copilot built specifically for **Physicians and Medical Office Assistants (MOAs)** in primary care outpatient clinics. It eliminates clinical burnout ('pajama time') through Ambient Voice Scribing, connects doctors directly to patients via 1-Tap WhatsApp outreach, inspects continuous Apple Watch telemetry, and automates administrative paperwork.

TAB 0: 0:00 – 0:40 | Top Header & Active Patient Context Banner

[ON-SCREEN ACTION]: Start on the main app screen. Point to the top header showing the logged-in Attending Physician (Verified Healthcare SSO), the 'Hands-Free Nav' microphone button, and the Active Patient Banner across the top.

"Hello judges and evaluators. My name is Suganthan Subramanian, graduate researcher in eHealth and Biomedical Engineering at the University of Ottawa. Today, I am proud to present Prime Care Medical Office Assistant—an intelligent, full-stack EHR platform designed specifically for physicians and clinic staff to eliminate administrative burnout.

Right across the top, you see our clinical header with verified physician SSO and our Hands-Free Voice Navigation engine, allowing doctors to navigate the entire chart hands-free while examining patients.

Below the header is our Active Patient Banner. It provides immediate clinical context: patient name, allergies like NKDA, MRN, phone number, and a live Apple Watch vitals indicator showing real-time heart rate and blood pressure.

Crucially, notice this green WhatsApp icon: with a single tap, the physician can launch a direct, pre-filled WhatsApp conversation to follow up with the patient, bridging clinic records with instant patient communication."

TAB 1: 0:40 – 1:25 | Today's Clinic Dashboard

[ON-SCREEN ACTION]: Click on 'Today's Clinic' in the left sidebar. Scroll over the Weekly Hours Saved chart, the Productivity ROI Benchmarks, and the Apple Watch Vitals preview widget.

"Our first core pillar is 'Today's Clinic'.

This is the physician's command center. The weekly productivity chart tracks clinical hours saved—consistently reclaiming 3 to 5 hours of administrative time each week.

To the right, our clinical ROI benchmarks demonstrate proven impact across specialties: in Orthopaedics, after-clinic documentation drops to zero minutes while billings increase by 79%. In Cardiology, STAT turnaround times drop dramatically.

Down below, the dashboard embeds our live Apple Watch telemetry preview, displaying the active patient's resting heart rate curve, blood pressure, and sleep duration harvested directly from Apple HealthKit."

TAB 2: 1:25 – 2:15 | Patients & Watch (Patient Directory)

[ON-SCREEN ACTION]: Click on 'Patients & Watch' in the sidebar. Show the directory of 60 unified patients. Click on the ■ 'Watch' button on a patient row to open the Apple Watch Vitals Modal. Then point to the 'Push to Scribe' button.

"Next, let's open our second pillar: 'Patients & Watch'.

Here, our directory unifies 60 patients across our central AWS App Runner cloud database and local clinic records. Doctors can filter by chronic conditions such as Hypertension or Diabetes.

When I click on the Apple Watch icon for any patient, it opens our dedicated Apple Watch Telemetry Modal. It displays live

biometrics: continuous heart rate, blood pressure, oxygen saturation at 98%, and sleep stages.

Now look at this key innovation: the 'Push to Scribe' button. With one click, the doctor can push this entire Apple Watch telemetry summary directly into the patient's clinical note, eliminating manual chart transcription completely!"

TAB 3: 2:15 – 3:05 | Ambient AI Scribe (Clinical Consultation Voice AI)

[ON-SCREEN ACTION]: Click on 'Ambient AI Scribe' in the sidebar or from the patient banner. Show the floating Scribe window. Point to the microphone button, the SOAP note panels (Subjective, Objective, Assessment, Plan), and the billing codes.

"Our third pillar is our most powerful clinician tool: the Ambient AI Scribe.

During a patient encounter, the physician simply taps the microphone. The Scribe passively listens to the doctor-patient dialogue using Whisper Speech-to-Text and automatically synthesizes a complete, structured SOAP note—Subjective, Objective, Assessment, and Plan—within seconds.

It extracts diagnostic and provincial billing codes (such as OHIP and ICD-10) automatically. It also includes one-click clinical actions: 'Translate for Patient' to generate a plain-language summary, 'Export to FHIR', and 'Sign Chart Electronically'.

Critically, for healthcare privacy compliance under Ontario's PHIPA and federal PIPEDA, the Scribe supports running 100% locally and offline using Ollama with Gemma 2, preventing any protected health information from leaking to external clouds."

TAB 4: 3:05 – 3:45 | Inbox & WhatsApp Triage

[ON-SCREEN ACTION]: Click on 'Inbox & WhatsApp' in the sidebar. Show the clinical triage inbox with Unread, Starred, and Resolved folders. Open the WhatsApp Bot Simulator / Webhook view.

"Our fourth pillar is 'Inbox & WhatsApp'.

This solves the inbound clinical triage bottleneck. The inbox organizes laboratory results, cardiology consults, and direct incoming patient messages.

Through our Meta WhatsApp Cloud webhook, patients can message the clinic directly with their home blood pressure readings or symptom updates. Our FastAPI backend verifies the webhook signatures, parses the inbound vitals, and automatically categorizes them in the doctor's triage queue so urgent issues are immediately addressed."

MORE MODULES: 3:45 – 4:15 | Intake OCR, Referral Triage & Doctor's AI Chart Chat

[ON-SCREEN ACTION]: Click 'MORE MODULES' in the sidebar. Briefly highlight 'Intake OCR Engine', 'Referral AI Triage', and click on 'Inbound Summary' to show the Doctor's AI Chart Review Chat.

"Under 'More Modules', we have additional specialized clinical engines:

• Intake OCR Engine: Uses multimodal parsing to extract data from paper disability and intake forms, automatically filling coordinates on standard PDFs.

• Referral AI Triage: Evaluates inbound specialty consults against Canadian practice guidelines to prioritize urgent surgical and oncology referrals.

• Inbound Chart Review: This is our AI Clinical Assistant for physicians. Doctors can load multi-page hospital discharge summaries, and the AI extracts critical medication changes and allows the doctor to query the chart conversationally.

We also include our 3D Digital Twin for synchronized CT slice viewing and our automated OHIP Billing Dashboard."

CONCLUSION: 4:15 – 4:35 | Summary & Clinician Impact

[ON-SCREEN ACTION]: Return to the main Dashboard view.

"In summary, Prime Care Medical Office Assistant is a complete, working clinical solution:
1. It frees physicians from hours of pajama-time documentation with Ambient Voice AI.
2. It bridges real-time Apple Watch telemetry directly into clinical charts.
3. It establishes instant patient communication via 1-Tap WhatsApp outreach.

As an engineering researcher at the University of Ottawa, I built this full-stack system to give physicians their time back so they can focus on what matters most: patient care.

Thank you very much!"
